

Lifelong Learning in Chicago

Sarah Nolimal and Azalea Rudolph

for Dr. Leodis Scott at the LearnLong Institute

GEO242
11/20/2017

Project Summary

This project was undertaken with Dr. Leodis Scott, a professor at DePaul University and the co-founder of the LearnLong Institute for Education and Learning Research. The goal of this project was to look at where Chicago, IL currently stands as a “Learning City.” A Learning City bases its education model as a service to society, where learning takes place throughout one’s life, giving all citizens the knowledge and opportunity to prosper. To map learning in Chicago, we mapped learning facilities that fell within the “Learning to Be” category of Canada’s Composite Learning Index, simplifying them as locations to access Media, Culture, and Sports.

The major concerns in the project came from accessibility to data about locations, and location decisions. Datasets from the City of Chicago Data Portal were extensive, but in most cases, difficult to classify into our three categories, or lacking known facilities. In the final output, we acknowledge that the maps are not decisive; for example sports stadiums were only placed under Sports, but these stadiums hold shows, concerts, and workshops that can fulfill all three categories of lifelong learning. Similar problems arose when choosing datasets, such as cultural centers whose business licenses specify liquor distribution, or a museum dataset that ignored small scale cultural museums. These issues led us to unconventional sources like Yelp.com to find location data.

At the core of this project lays the fact that this is the first instance of looking at a U.S. city in terms of LifeLong Learning. Whereas Canada has test results and other such datasets to analyze, we were hindered by unexpected obstacles such as Hispanic peoples categorized as White in U.S census data and highly interpretive datasets. In spite of procedural setbacks, the outcome of this project shows trends in the locations of learning facilities and income and education status, suggesting unequal lifelong learning facility distribution both demographically and geographically.

Introduction

Lifelong Learning is the continuation of education beyond formal education. At the simplest level, LifeLong Learning is achieved through attending classes, events, exposure to different people and places, training in and outside of class, and vocational and non-vocational training. This kind of education continues through self-action beyond and sometimes in spite of regular schooling and institutions.

While Canada has become the frontrunner in analyzing and implementing Lifelong Learning into their cities, the United States is yet to even regularize use of the term Lifelong Learning. The client, Dr. Leodis Scott, is a college professor who believes that Lifelong Learning would be a step in the right direction for education in this country. Chicago, Illinois is the third highest populated city in the country, and with new construction, low high school graduation rates, and infamous gentrification, is the most fascinating city for mapping when it comes to learning and education.

The greatest problem with this project is its originality in the United States. This country as a whole does not have the datasets necessary to observe Lifelong Learning in the same manner that Canada and some European countries do. Dr. Scott has already written a book on the topic of Learning in the United States. He sees Lifelong Learning as an education product that is created by and for all members of society. This includes taxpayers, business and political peoples coming together as partners in order to confront education (Scott, 2015), an issue that is currently running rampant in Chicago. In order for Chicago to become a Learning City, it must implement learning opportunities that can be invested in throughout a citizen's life, beyond the regular schooling system. The end goal of building a successful Learning City is giving the population personal and financial growth and opportunities that they would not have otherwise; allowing the mental and monetary value of all Chicagoans to prosper.

Needs Assessment

Dr. Scott worked with us to determine how we would map physical locations of lifelong learning within three indicators of “learning to be,” the subject pillar of lifelong learning in this project. Lifelong learning facilities are grouped into three categories: media, sports, and culture. Access is determined by neighborhood, and demographic data is used to determine who has access to lifelong learning.

The concept of “lifelong learning” and “learning cities” are foreign to Americans. This project is the first mapping project that Dr. Scott has endeavoured through his Lifelong Learning research, and comparable American projects do not exist, nor do international lifelong learning mapping projects. Our first meeting with our client focused on how we define Lifelong Learning for citizens in United States, particularly Chicago. While Canada has its own Composite Learning Index (CLI) that measures the progress the country has made in Lifelong Learning, the United States does not have the testing measures in place that Canada does, making it difficult for our group to illustrate Learning in the same way.

Dr. Scott provided Canada’s CLI to provide a basis of methodology and to share the data that has been previously used to measure lifelong learning. He explained that in mapping Chicago, he was most interested in one of the four pillars of learning, *Learning to Be*. This was the most important part of our Needs Assessment. The other pillars look at Learning to Know, Do, and Live Together, whose indicators and measures were either extremely specific or extremely broad, prohibiting the application of the American data available to us. Learning to Be has 5 indicators: Exposure to Media, Learning through Culture, Learning through Sports, Broadband Internet Access, and Access to Cultural Resources. The provided CLI was from 2010; we decided that access to broadband and exposure to media were outdated in terms of being separate indicators, and thus merged them. Further, our project is examining both the locality of cultural resources and access to them, and so we also elected to merge learning through culture and access to cultural resources.

Chicago is a large and engaging city; mapping every single location where citizens engage in “learning to be” is decidedly impossible, due to both the unavailability in data and the sheer amounts of locations. As an example, music lessons could be included as a measure of learning through culture. In Chicago, there are dedicated studios where music lessons occur; however, there are also a multitude of private lessons, including lessons provided within a family. “Learning to be” occurs throughout time and space; mapping “learning to be” cannot be

exhaustive. Rather, we sought to map centers of “learning to be” and locations where the public may “learn to be” together. Therefore, we mapped nine types of “lifelong learning facilities”, or locations where people can come together to “learn to be”, grouped into indicators from the CLI: “media,” “sports,” and “culture.” The media indicator consists of two lifelong learning facility types: libraries and Connect Chicago locations. The sports indicator also consists of two lifelong learning facility types: sports facilities provided by the Chicago Park District and professional sports stadiums. The culture indicator consists of three types of lifelong learning facilities: cultural centers, museums, and community gardens. Most of the locations we mapped are free to use. However, there are locations unique to Chicago where lifelong learning occurs, namely the museums and sports stadiums, and it would be a highly inaccurate representation of Chicago’s lifelong learning to exclude these institutions.

Dr. Scott expressed interest in using demographic data of community areas, or neighborhoods, in order to determine who has access to lifelong learning. The demographics he was most interested in were income, education, age, gender, and race. After encountering issues in how Hispanics are counted in the US census, we excluded race from the final maps so as not to lead to confusion (mapping race would have to include frontlines communities as “white”, and a separate map would have to differentiate the two, but would not include any other racial group).

The basis of the entire project centers around the term “Learning City.” In Dr. Scott’s book, he defines his version of a Learning City as a society where all members have access to lifelong learning facilities, and that they make use of these facilities. When considering the facilities that fit into our three pillars, we aimed to display Chicago learning facilities on a map as the first step in considering where the city stands as a Learning City, and to think about the next steps LearnLong Institute needs to consider in making Chicago an applicable, accessible Learning City.

System Requirements

Specific data requirements and processing requirements for display of data are described in detail.

Data requirements to display lifelong learning facilities in Chicago are the locations of lifelong learning facilities, the number of facilities in a neighborhood, and the people that live in each neighborhood. Key attributes for lifelong learning facilities are their location, either as an address or coordinates, the pillar they belong to (media, sports, or culture), and their specific type. Attributes for neighborhoods will be their name and polygonal shape. Attributes for people consists of census tract ID, income, education, age, and gender. Figure 1 presents the relationship of the necessary data and their attributes in a Chen notation entity-relationship diagram.

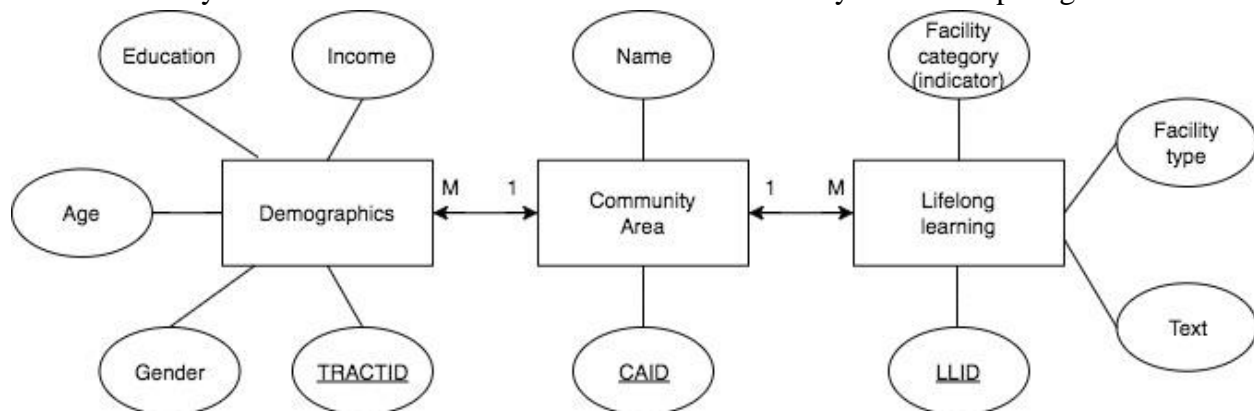

Figure 1. Chen entity-relationship diagram. There are many demographics (census tracts) in one community area, as well as many lifelong learning facilities in one community area.

Several data processing functions are required to create the final products with these attributes. First, the Cook County census tract shapefile is joined to the census table, based on the census tract ID feature key. The census data displayed with a choropleth map, and displays the mean income, percent of the population with a high school diploma or more, mean age, and sex ratio (male to 100 females) per census tract; this data did not require normalization for the map. Classification of census data was determined based on each attribute's data distribution, and classes were rounded to numbers divisible by five or ten.

Community areas were displayed over the census tracts. O'Hare was removed from the analysis because parts of O'Hare are in DuPage county, which created a gap in demographic

data. The community areas were joined spatially with the lifelong learning facilities to determine how many facilities are in each neighborhood.

Lifelong learning facilities were collected from either the City of Chicago Data portal or from yelp.com, thus both coordinate and address locations were processed. Coordinates were displayed using the X,Y function in ArcMap, while addresses were geocoded by ESRI. This created a point map of the lifelong learning facilities. For maps that also display census data, lifelong learning facilities were categorized by indicators (media, sports, and culture) rather than type (libraries, museums, etc.).

Data Acquisition

Data sources for this project are from the City of Chicago Data Portal, the American Survey, and, unusual to this type of project, yelp.com. The data collection process for this project speaks to the lack of consciousness of the public to the concept lifelong learning, and to the unreliability of the Chicago Data Portal for non-city managed locations. Here, each data piece is described individually in a 'data library', including technical aspects of the ArcMap object and processing steps for each piece of data are described in further detail.

File Name: Community Areas

Source: City of Chicago Data Portal

Description: boundaries of 77 neighborhoods

Processing Steps: Edit vertices to delete O'Hare; spatial join with lifelong learning facilities to determine number in neighborhood

Spatial Object Type: Polygon

Attributes: FID, Shape, Perimeter, Community, Shape_len, Shape_Area, Area, Comarea, area_number, Com_areaID, Area_num_1

Data Format: Shapefile

File Name: Census Tracts

Source: DePaul University (originally from TIGER)

Description: Shapes and locations of census tracts of Cook County

Processing Steps: Clip to Community Areas

Spatial Object Type: Polygon

Attributes: FID, Shape, GEOID10, Namelsad10, Aland10, Awater10, INTPTLAT10, INTPLON10, Shape_leng, Shape_Area

Data Format: Shapefile

File Name: Mean income

Source: United States Census Bureau, American Fact Finder

Description: Mean income of each census tract

Processing Steps: Table join to census tracts using GEO.id2 feature key

Spatial Object Type: Polygon

Attributes: GEO.i, GEO.id2, GEO.display-label, HC01_EST_VC01, HC01_MOE_VC01, HC02_EST_VC01, HC02_MOE_VC01, HC03_EST_VC01, etc.

Data Format: comma-separated value (.csv) file

File Name: Percent population with high school diploma or higher

Source: United States Census Bureau, American Fact Finder

Description: The percent of the population in each census tract that has a high school diploma or more (associates, bachelors, other higher degrees)

Processing Steps: Table join to census tracts using GEO.id2 feature key

Spatial Object Type: Polygon

Attributes: GEO.i, GEO.id2, GEO.display-label, HC01_EST_VC01, HC01_MOE_VC01, HC02_EST_VC01, HC02_MOE_VC01, HC03_EST_VC01, etc.

Data Format: comma-separated value (.csv) file

File Name: Median Age

Source: United States Census Bureau, American Fact Finder

Description: Median age in each census tract

Processing Steps: Table join to census tracts using GEO.id2 feature key

Spatial Object Type: Polygon

Attributes: GEO.i, GEO.id2, GEO.display-label, HC01_EST_VC01, HC01_MOE_VC01, HC02_EST_VC01, HC02_MOE_VC01, HC03_EST_VC01, etc.

Data Format: comma-separated value (.csv) file

File Name: Sex ratio

Source: United States Census Bureau, American Fact Finder

Description: The sex ratio of male to 100 females in a census tract

Processing Steps: Table join to census tracts using GEO.id2 feature key

Spatial Object Type: Polygon

Attributes: GEO.i, GEO.id2, GEO.display-label, HC01_EST_VC01, HC01_MOE_VC01, HC02_EST_VC01, HC02_MOE_VC01, HC03_EST_VC01, etc.

Data Format: comma-separated value (.csv) file

File Name: Libraries

Source: City of Chicago Data Portal, Chicago Public Library

Description: Locations of Chicago's city libraries.

Processing Steps: Geocode addresses

Spatial Object Type: Point

Attributes: Name, Hours of Operation, Cybernavigator, Teacher in the Library, Address, City, State, ZIP, Phone, Location

Data Format: comma-separated value (.csv) file

File Name: Connect Chicago locations

Source: City of Chicago Data Portal, Connect Chicago

Description: Locations of Connect Chicago, a program providing free WiFi and assistance in using the internet and computers

Processing Steps: Removal of library locations, XY data display

Spatial Object Type: Point

Attributes: ID, URL, Organization Name, Organization Type, Address, Building and Street, City, State, ZIP Code, Phone Number, Hours, Website, Appointment, Internet, WiFi, Training, PC Use Restrictions, Hardware public, Assistive Technology, Internet Upload, Internet Download, Volunteers Used, Volunteers Used How, Volunteers Wanted How, Public WiFi Detail, Nearest Parking, Nearest Parking Detail, Public Transportation Detail, Time Allowed per user, Time Allowed per User Detail, Room List, Handicap Access Detail, Friendly Description, Agency Leadership Contact, Agency Staff Person Contact Email, Twitter Handle, Training Type, Flickr tag, Training Headline, Training Detail, Training Description, Training URL, Location Leadership, Location Leadership Email, PCC Staff person, PCC Staff Person Email, Latitude, Longitude, Location

Data Format: comma-separated value (.csv) file

File Name: Parks – Chicago Park District facilities (current)

Source: City of Chicago Data Portal, Chicago Park District

Description: All city-managed individual sports facilities.

Processing Steps: Remove irrelevant (non-sports) facilities, remove repetition in spreadsheet so that 1 facility per park is displayed on map; XY data display

Spatial Object Type: Point

Attributes: ObjectID, Park_No, Park, the_geom, Facility_N, Facility_T, X_coord, Y_coord, GISobjID

Data Format: comma-separated value (.csv) file

File Name: Sports stadiums

Source: yelp.com, 'Professional Sports Teams' tag

Description: Collected data for professional sports stadiums in Chicago.

Processing Steps: Collecting addresses, geocoding by address

Spatial Object Type: Point

Attributes: ID, Name, Address, City, State, ZIP, Category, Type

Data Format: comma-separated value (.csv) file

File Name: Cultural centers

Source: yelp.com, 'Cultural Centers' tag; Chicago Park District 'Cultural Centers' webpage

Description: Collected data for cultural centers in Chicago.

Processing Steps: Collecting addresses, geocoding by address

Spatial Object Type: Point

Attributes: ID, Name, Address, City, State, ZIP, Category, Type

Data Format: comma-separated value (.csv) file

File Name: Museums

Source: yelp.com, 'Museums' tag

Description: Collected data for all museums in Chicago, including world-famous institutions like the Field Museum and unknown attractions like Stampland.

Processing Steps: Collecting addresses, geocoding by address

Spatial Object Type: Point

Attributes: ID, Name, Address, City, State, ZIP, Category, Type

Data Format: comma-separated value (.csv) file

File Name: Community gardens

Source: cuamp.org (Chicago Urban Agriculture Mapping Project)

Description: Community gardens only (CUAMP also includes demonstration gardens, urban farms, etc.)

Processing Steps: Display XY data

Spatial Object Type: Point

Attributes: Growing Site Name, Is Growing Site Locked?, Evidence of Support Organizations?, If its a community garden, is it collective or allotment?, Choose growing site types, Water, Compost system, Structures and features, Season extension techniques, animals, Address, Food Producing, Community Garden, Is growing site dormant?, latitude, longitude, address, Ownership, Other support organizations, growing site website, Facebook, Is growing site fenced?, Description, Ward, Communities, Public Contact Info, Growing site image, Municipalities

Data Format: comma-separated value (.csv) file

Data Analysis and Visualization

The process of visually analyzing the collected data for optimal visual display and the numeric data analysis are described.

9 different types of points were mapped in Chicago with a grand total of 1,129 total points. Especially for mapping over census data (which is already very visually dynamic in itself), the points were classified into their indicators for use on census maps; libraries and Connect Chicago locations are simply “media,” sports facilities and stadiums are “sports,” and cultural centers, museums, and community gardens are “culture.” The primary reason for this broad classification is visual simplicity and communication; 9 different point colors is much more crowded than 3. However, because distinctions within each indicator do exist, a separate map was included that only displays lifelong learning facilities and neighborhoods is included.

Lifelong learning facilities and neighborhoods were spatially joined to determine the number of facilities in each neighborhood. The neighborhood with the most learning facilities and the three neighborhoods with the least were compared using census tract information to examine the influence of income, education, age, and gender on the availability of lifelong learning facilities to residents of a neighborhood. This analysis was then run again on a per-capita basis: the census tracts of neighborhoods with the most lifelong learning facilities per capita and the neighborhoods with the least facilities per capita were examined for general trends.

Results

West Town residents have the highest geographic access to lifelong learning. Fuller Park, Burnside, and West Elsdon have the lowest; however, facilities population of community areas are not equal. Fuller Park, Burnside, and West Elsdon combined have less population and area than West Town. Per person, these four neighborhoods are very similar, and East Garfield Park has the most facilities per person while Brighton Park has the least. Visually, there is still a pattern of more learning facilities present in Northern neighborhood like West Town than Southern neighborhoods like Fuller Park.

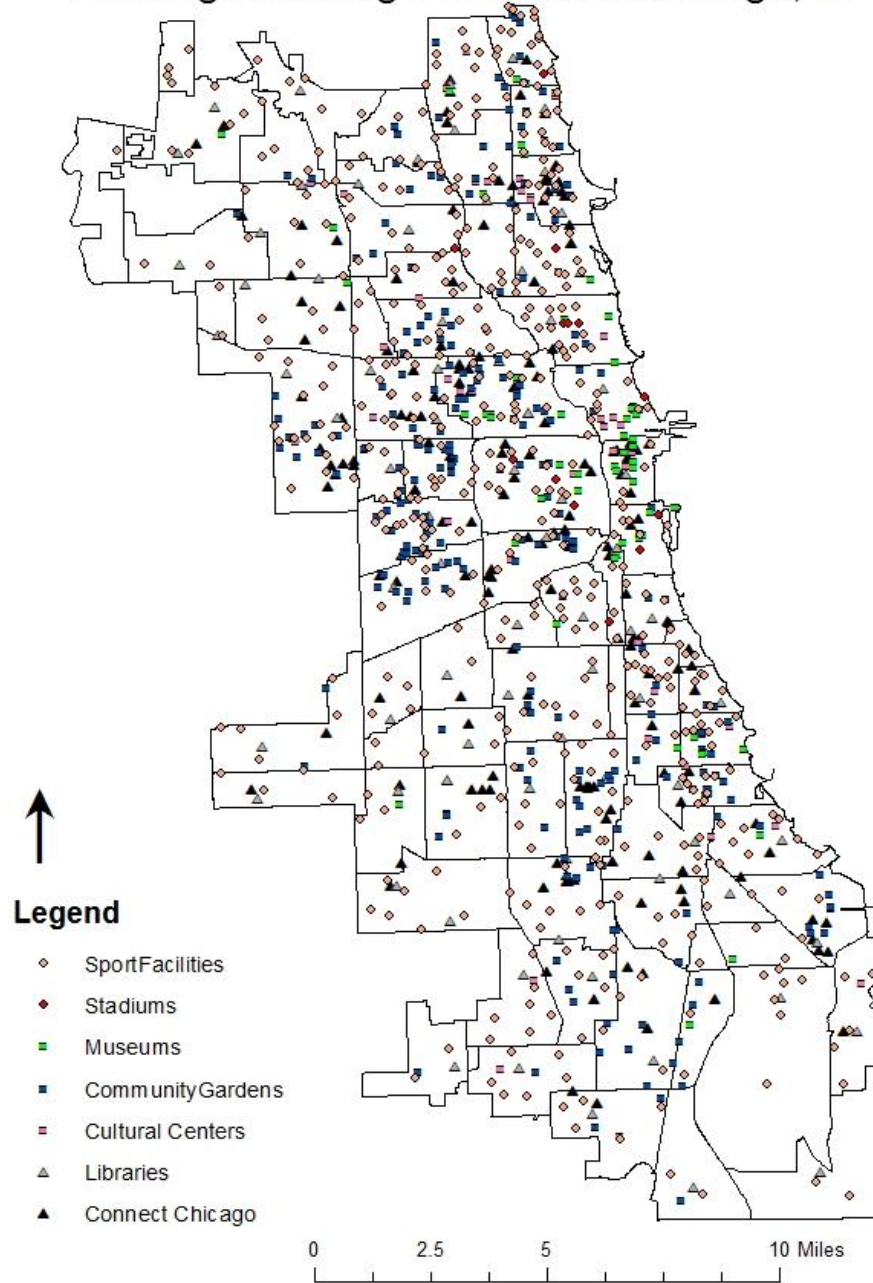

Maps 1 to 4 show the lifelong learning facilities, grouped into the three indicators, over census tract-level demographic information and Chicago's neighborhoods. In general, there are more lifelong learning facilities on the North Side, and more facilities in wealthier areas and in more educated areas West Town, the neighborhood with the most lifelong learning facilities (56 total facilities), is also a wealthy neighborhood, with the mean income of its census tracts ranging from \$70,000 to \$188,000 (Map 2) and the percent of the population with a diploma or more ranging from 72% to 98% (Map 3). Burnside, Fuller Park, and West Elsdon all have the lowest number of lifelong learning facilities (2 each, both sports facilities). These neighborhoods have income levels ranging from \$30,000 to \$59,000 (Map 2), and the percentage of the population with a diploma or more range from 63% to 79% (Map 3). Though this appears to indicate a trend, some border neighborhoods disrupt these income and education trends. Mount Greenwood, on the far Southwest side, has only 4 lifelong learning facilities, but has a mean income that ranges from \$85,000 to \$102,000 (Map 2) and the percent of the population with a diploma or more ranges from 93% to 97% (Map 3). Table 1 (Appendix B) shows a summary of the amount of lifelong learning facilities in each neighborhood. No clear gender or age differences between neighborhoods with many lifelong learning facilities and neighborhoods with few lifelong learning facilities were observed (Maps 4 and 5).

Table 2 (Appendix B) provides a more nuanced summary of lifelong learning facilities in each neighborhood per capita. The number of facilities was divided by the population (as of 2010) of each neighborhood to better balance population disparities and to provide a more in-depth analysis. West Town, for example, as a population of 81,432, while Fuller Park's population is only 2,876. Lifelong learning facilities per person in each neighborhood presents a very different perspective than total facilities per neighborhood. While West Town and Fuller

Park were opposite ends of the spectrum for number of facilities in the neighborhood, per person, they are very similar, having 0.0068769 facilities per person and 0.00069541 facilities per person, respectively. Per person, Fuller Park has more lifelong learning facilities than West Town.

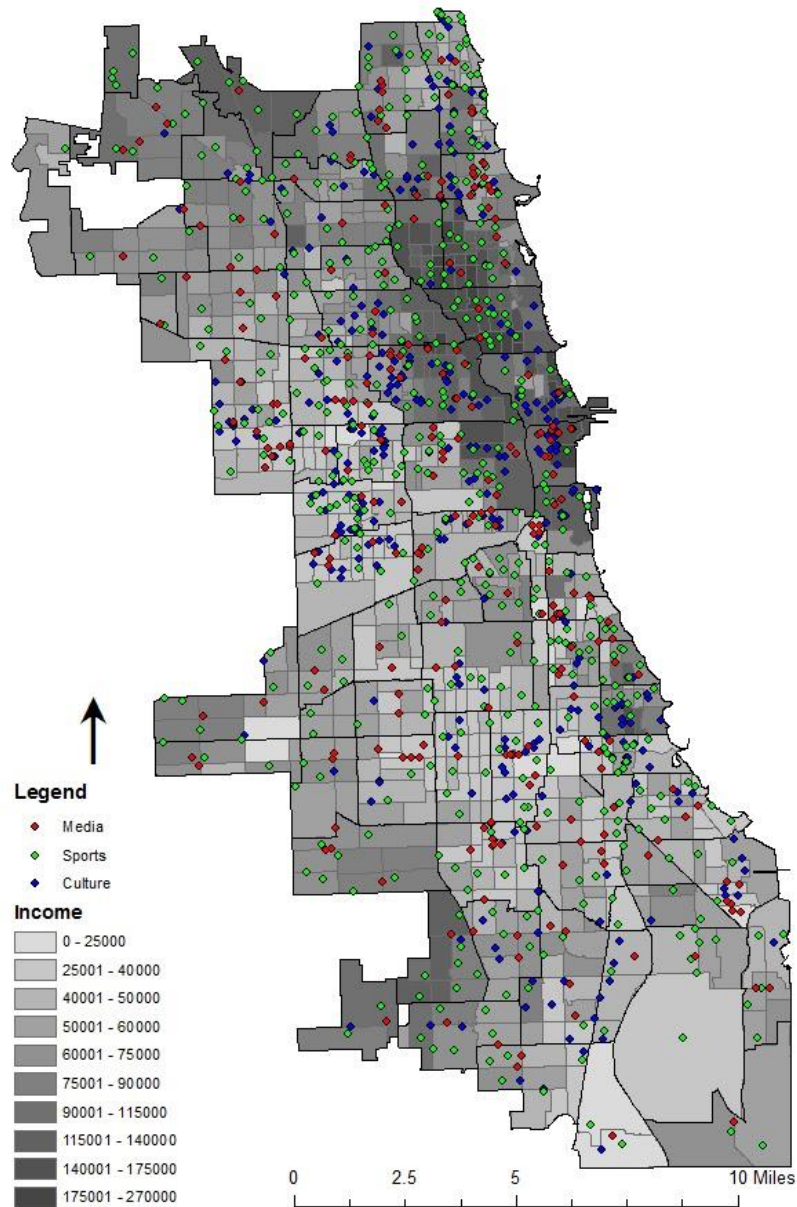

Per person, East Garfield Park has the most lifelong learning facilities per person at 0.0013614, and Brighton Park has the least at 0.00008168. The trends previously observed in lifelong learning facility abundance are absent in a per-person analysis. East Garfield Park's income ranges from \$22,000 to \$56,000 (Map 2), placing it in a lower income bracket, and the percent of the East Garfield Park population with a high school diploma or more ranges from 60% to 92% (Map 3). Income in Brighton Park ranges from \$38,000 to \$57,000 (Map 2) and the percent of the population with a high school diploma or more ranges from 41% to 69% (Map 3), possibly indicating that the population with the least access to lifelong learning in Chicago is also that which has the least formal education. East Garfield Park does have a wider median age range of 25 to 35, compared to Brighton Park's 30 to 35. East Garfield Park has a slightly lower male to female ratio than Brighton Park that ranges from 68:100 to 120:100 (compared to Brighton Park's 80:100 to 120:100).

Lifelong Learning Facilities in Chicago, IL

Income and Learning Facilities In Chicago, IL

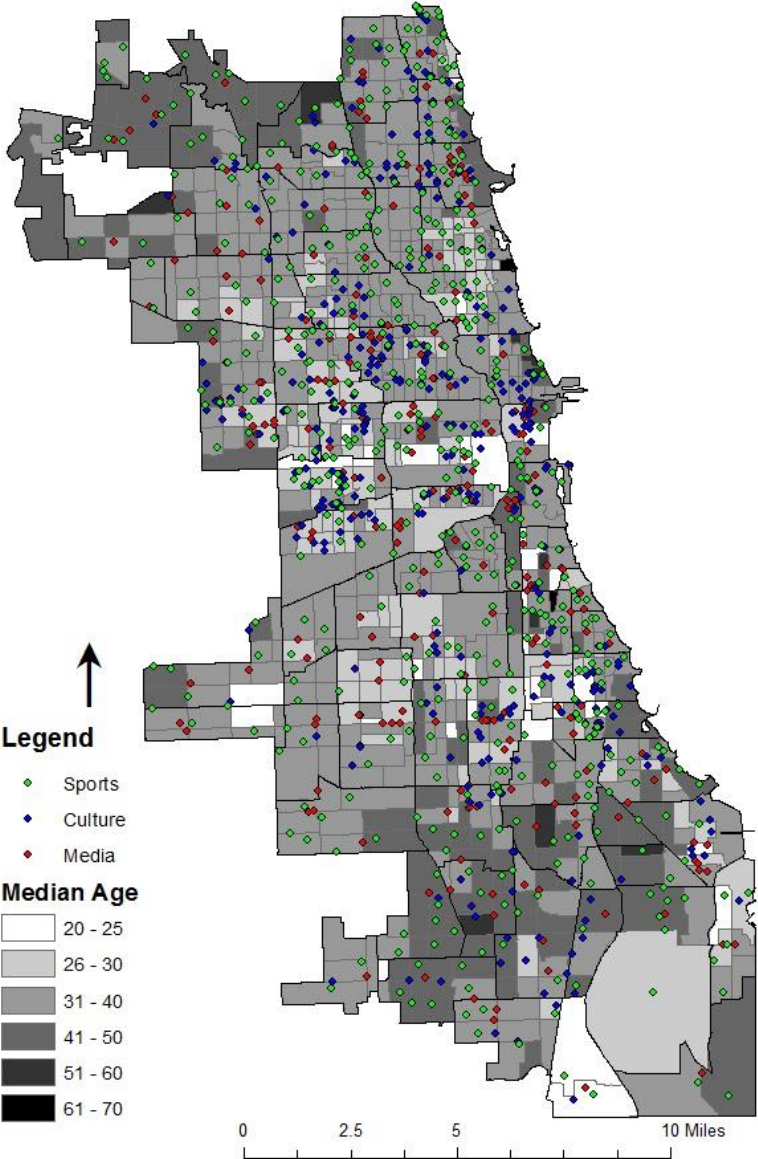

Map 2: Average income per community area and Learning to Be Facilities in Chicago.

Education and Lifelong Learning in Chicago, IL

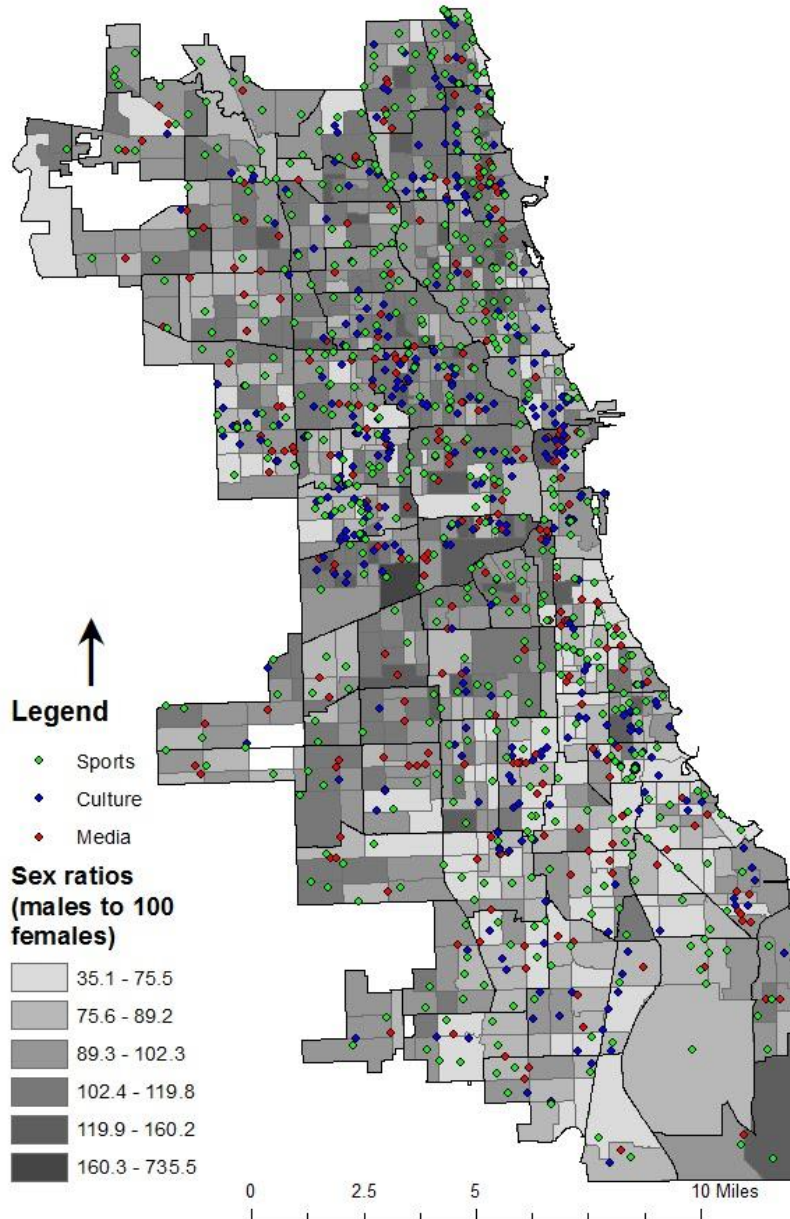

Map 3: Percentage of residents per community area that have at least a high school diploma and Learning to Be Facilities in Chicago.

Age and Lifelong Learning Facilities in Chicago, IL

Map 4: Median Age of residents per community area and Learning to Be facilities in Chicago.

Sex and Lifelong Learning Facilities in Chicago, IL

Map 5: Ratio of men to women per community area and Learning to Be Facilities in Chicago. Higher ratios corresponds to more men per each woman.

Conclusions and Recommendations

This project mapped three categories of Learning Facilities as inspired by the Canadian CLI: Media, Culture, and Sports. These points were mapped over census data to create four maps comparing learning facilities locations to income, education level, age, and gender (sex ratio). An additional map was included to display each type of lifelong learning facility that was mapped in this project, grouped by shape into the categories media, culture, and sports. The number of facilities in each neighborhood was determined; then, to account for population differences, the number of facilities per person in each neighborhood was determined.

Fuller Park has the lowest number of Learning Facilities, while West Town has the most. However, per-person, Fuller Park ranks slightly above West Town. Per person, East Garfield Park has the highest amount of lifelong learning facilities, while Brighton Park has the least. Through visual and data analysis, there is an indicated trend of neighborhoods having higher Facilities in more affluent communities. However, there are also counterexamples to this; for example, with a median income range of \$85,000 to \$102,000 and over 90% population with at least a high school diploma, Mount Greenwood currently ranks in the bottom 10 for Learning Facilities per person. Additionally, though East Garfield Park has the highest amount of lifelong learning facilities per person, its residents fall into lower income brackets than residents of West Town. There was no clear trend between lifelong learning facilities and age or gender.

When measuring population to facilities, all three types of facilities were included at equal value. The type of facility that is present in the neighborhoods is still something that can be further investigated. For example, Fuller Park's lone two facilities were sports facilities. This was a trend for the community areas with the lowest facilities- Fuller Park, Burnside, and West Elsdon were all tied at two Sports Facilities total for lifelong learning. Changing the value placed on any type of learning facility may change the trends determined by this project.

This project was completed to serve as the base for follow-up research by the LearnLong Institute. The data acquisition for these studies proved to be the most difficult, as lifelong learning can take place through space and time, and is difficult to pinpoint in mapping and data analysis. For example, workshops hosted through companies like Michael's craft store are an example of lifelong learning, but not all of these stores host workshops, and those that do only do so periodically for a scheduled event. Furthermore, as evidenced by unorthodox methods that were used to collect data for this project, neither the city of Chicago nor the United States as a whole has not prepared data useful for Lifelong Learning analysis.

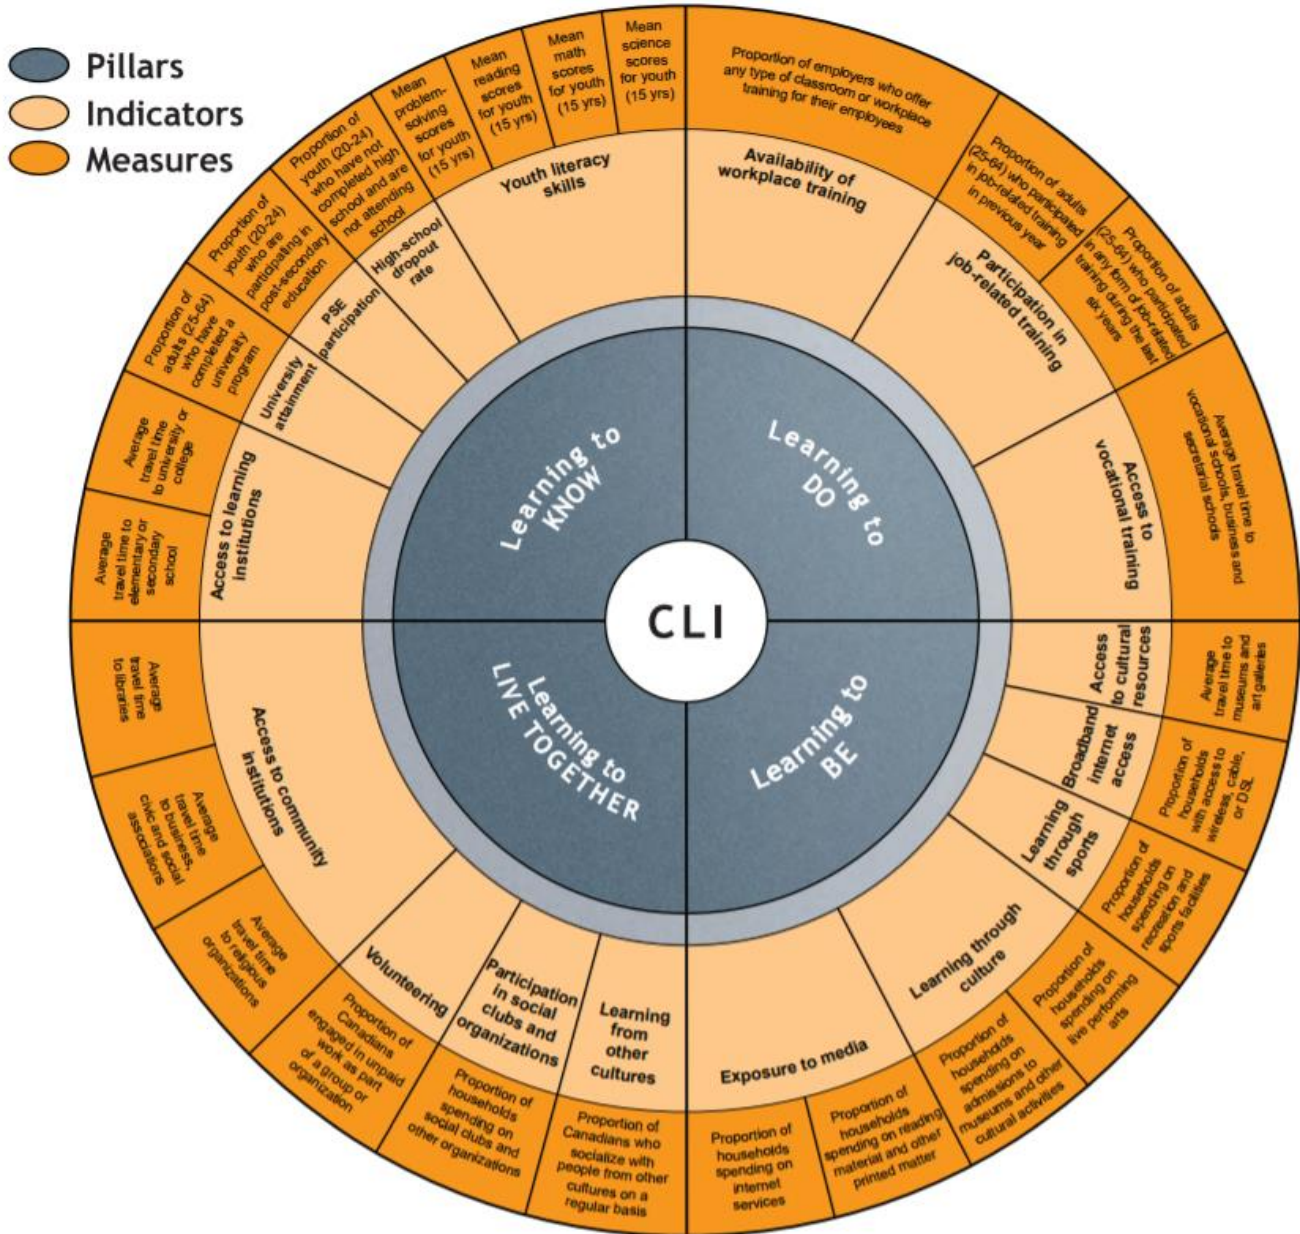

In follow-up projects, the values given to all the types of learning facilities should be considered, along with distance and accessibility by transportation. In the early stages, we planned to include distance to transit stops. However, this is a complex aspect of Chicago; living near a train stop is more profusive than living near a bus stop, and living far from either can be either be regarded positively as a suburban neighborhood in which residents have cars, or it can an example of inaccessibility. The value of distance to the type public transit, CTA, Metra, bus, train, etc. is something that fell outside of the range of this project and could be considered in

continued research to better measure how geographically accessible lifelong learning facilities are.

Appendix A

The Canadian Learning Index provided guidance for location selection and categorization.
